# 1 Introduction

These notes serve as a single source of knowledge in which those reading should ideally be able to garner a deeper understanding of the thoughts and ideas about piecewise objects I have had and continue to have.

To consider something piecewise is to enumerate something under differing conditions. For example, one might consider the function  $|x|$  piecewise, namely when  $x \geq 0$  or  $x \leq 0$ .

An object which is piecewise is something which contains a set of pieces, which themselves contain values and conditions, under which those values are taken for the overall object. Continuing with the example of  $|x|$ , we have the piece value  $x$  for when  $x \geq 0$  (which forms a piece), and  $-x$  for when  $x \leq 0$ .

We shall develop ideas such as above more explicitly throughout these notes. These ideas often intersect with other areas of maths, which one might be familiar with - but if not, don't panic; such ideas are not strictly foundational to the presented notes.

Furthermore, these notes focus on construction (not to be confused with constructivism); rather than evaluating existing concepts or formulas, we focus on deriving existing or new tools, ideas and formulas. For you, reader, this must be a process you should become familiar with, and rather than just reading these notes, attempt to follow along by hand, and construct your own objects using the ideas presented here. We also stress that with ideas that intersect with more mainstream mathematics, that existing concepts be used to evaluate the validity of the constructions.

Finally, if you have trouble understanding some of the ideas presented here, you should consider taking a look at the blog posts on <https://piecewise.org> or contacting myself at [ally@piecewise.org](mailto:ally@piecewise.org). The things you'll see here are the culmination of many hundreds of hours scribbling, doodling and refining thoughts over the course of several years. More importantly than the fact I am myself still learning the fundamentals of mathematics at a higher level, is that you understand that trial and lots of error forms the majority of this work.

Thank you in advance for reading.

## 2 Notation

### 2.1 Single variable piecewise functions

A piecewise *function* is a function defined over several pieces.

Let us consider some function  $f : \mathbb{R} \rightarrow \mathbb{R}$  and some intervals  $D_1, D_2, \dots, D_n \subseteq \mathbb{R}$  such that  $D_1 \cap D_2 \cap \dots \cap D_n = \emptyset$ . Suppose we have some functions  $f_1 : D_1 \rightarrow \mathbb{R}$  and so on. We describe this function using the following notation:

$$f(x) = \begin{cases} f_1(x) & x \in D_1 \\ f_2(x) & x \in D_2 \\ \vdots & \vdots \\ f_n(x) & x \in D_n \end{cases}$$

This same function could instead be written as the following:

$$\begin{aligned} f : D_1 &\rightarrow \mathbb{R}, f(x) = f_1(x), \\ f : D_2 &\rightarrow \mathbb{R}, f(x) = f_2(x), \\ &\vdots \\ f : D_n &\rightarrow \mathbb{R}, f(x) = f_n(x) \end{aligned}$$

This essentially describes the same function over different domains. Alternatively, one might think about it as different functions under the same label,  $f$ .

Reading this function more verbosely, we say that if  $x$  is in the domain  $D_1$  and so on, then we might ‘choose’ to have  $f(x) = f_1(x)$  as per our definition.

**Example 2.1** (Absolute value function). Let us define the absolute value function,  $|x|$  as the following:

$$|x| = \begin{cases} x & x \geq 0 \\ -x & x \leq 0 \end{cases}$$

To evaluate, for example,  $|-3|$ , we use the definition:

$$|-3| = \begin{cases} -3 & -3 \geq 0 \\ 3 & -3 \leq 0 \end{cases}$$

Since the condition in the second piece (or case) evaluates to true, we use the value in that piece. That is, since  $-3 \leq 0$  is true,  $|-3| = 3$ .

## 2.2 Piecewise functions

Piecewise functions needn't be restricted to a single variable. More generally, piecewise functions needn't be restricted to any number of conditions or pieces. The perfect example, as we'll see later, is the floor function, which has an infinite number of pieces. Similarly, the bivariate function describing a square when it intersects a certain plane has 4 pieces.

In general, we can notate such a more general piecewise function like the following:

$$f(x) = \begin{cases} f_1(x) & C_{1,1} & C_{1,2} & \dots & C_{1,m} \\ f_2(x) & C_{2,1} & C_{2,2} & \dots & C_{2,m} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ f_n(x) & C_{n,1} & C_{n,2} & \dots & C_{n,m} \end{cases}$$

Where  $C_{p,q}$  is some condition which evaluates to true or false for some inputs (e.g. a predicate). We interpret the string of conditions in each piece, such as  $\{C_{1,1} \ C_{1,2} \ \dots \ C_{1,m}\}$ , as equivalent to the condition  $C_{1,1} \wedge C_{1,2} \wedge \dots \wedge C_{1,m}$ .

Such conditions could be anything, and per the section above, we could have  $C_{p,q}$  denote the predicate  $x \in D_{p,q}$  for some set  $D_{p,q}$ .

Importantly, we note in general this piecewise object is written in a shortened form, without commas or English terms such as 'and' or 'or', or their respective logical operators. This is a conventional decision in these notes given the number of piecewise objects written. For example, the following is identical to the above:

$$f(x) = \begin{cases} f_1(x), & \text{if } C_{1,1} \wedge C_{1,2} \wedge \dots \wedge C_{1,m} \\ f_2(x), & \text{if } C_{2,1} \wedge C_{2,2} \wedge \dots \wedge C_{2,m} \\ \vdots & \vdots \\ f_n(x), & \text{if } C_{n,1} \wedge C_{n,2} \wedge \dots \wedge C_{n,m} \end{cases}$$

And of course we might package each piece's conditions together, effectively making one condition per piece. Though, in practice, this doesn't help very much at all (this is because, as we will later see, considering each condition individually yields results which affect the way we interpolate functions and other manipulation of piecewise objects).

## 2.3 Generalised piecewise object

Finally, we might consider a set-like generalised form of a piecewise object. Let us denote the following:

$$\phi = \{\phi_i, \ C_i \mid i \in I\}$$

Where  $\phi$  describes the piecewise object, and for each  $i \in I$  (the iterator),  $\phi = \phi_i$  for when  $C_i$  is true.

**Example 2.2** (Expanding a generalised piecewise object). Suppose we have a set  $I = \{1, 2, \dots, n\}$  and a piecewise function  $f$  such that  $f = f_i$  when  $C_i$  is true.

We can express this function as:

$$f = \begin{cases} f_1 & C_1 \\ f_2 & C_2 \\ \vdots & \vdots \\ f_n & C_n \end{cases}$$

Alternatively, we might express it using the generalised notation:

$$f = \{f_i, \quad C_i \mid i \in \{1, 2, \dots, n\}\}$$

**Example 2.3** (Floor function). We will see the floor function later on where it will be described more deeply, but we can introduce it like so using our notation:

$$\lfloor x \rfloor = \{n, \quad x \in [n, n+1) \mid n \in \mathbb{Z}\}$$

To evaluate this function at  $x = 3.5$  consider that for all  $n \in \mathbb{Z}$  there exists only one such interval  $N = [n, n+1)$  such that  $3.5 \in N$ . This interval is  $[3, 4)$ , i.e.  $n = 3$ ; the corresponding piece value is 3 and so  $\lfloor 3.5 \rfloor = 3$ .

If a single iterator (e.g.  $i \in I$ ) isn't sufficient to describe the piecewise object we desire, we might consider using several;  $i \in I, j \in J$  for example). Alternatively, we might consider joining two piecewise objects together using  $\cup$ :

$$\varphi = \phi_1 \cup \phi_2 = \{\phi_{1,i}, \quad A_i \mid i \in I\} \cup \{\phi_{2,j}, \quad B_j \mid j \in J\}$$

This can be interpreted similarly to before, though we now have that  $\varphi = \phi_{1,i}$  if  $A_i$  is true for some  $i$ , or  $\varphi = \phi_{2,j}$  if  $B_j$  is true for some  $j$ .

Notably, this notation can be used to express individual pieces explicitly in a piecewise object rather than collectively. If such a piece isn't dependent on the iterator, we can ignore that part entirely (keeping in mind we might be able to rewrite it using an iterator later on).

**Example 2.4** (Absolute value function). Recall the absolute value function; see Example 2.1.

We can then express  $|x|$  as:

$$|x| = \{x, \quad x \geq 0\} \cup \{-x, \quad x \leq 0\}$$

### 3 Algebra on Piecewise Objects

3.1 (De)nesting pieces; logical ‘and’

3.2 Combining, splitting piece conditions; logical ‘or’

3.3 Functions on piecewise objects
